SHARK

FACTS

Sharks live in every ocean on the planet.

Unlike fish, sharks can only swim forward. That is because their fins are stiff and cannot be controlled by muscles.

Sharks have been living in Earth's oceans for 450 million years.

You can measure the age of a shark by counting the rings on its vertebrae.

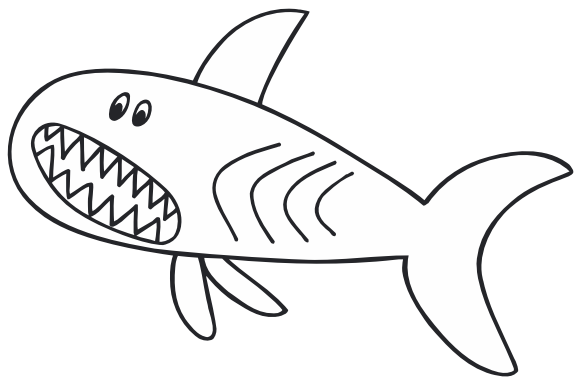

Sharks can move both their lower and upper jaws.
Sharks have the largest brains of any fish.

Large sharks live longer than smaller sharks.

Great whites can jump out of the water up to ten feet.

Sharks have ears that are located **INSIDE** their heads.

Most sharks never sleep because they have to constantly pump water through their mouth over their gills to breathe or they will die.
